The invention relates to diagnosing cancer other than prostate cancer in a male mammal, comprising assaying a test sample for increased level of semenogelin, or cancer in a female by assaying for the presence of semenogelin, according a semenogelin protein or polypeptide fragment or a semenogelin. Administering a semenogelin protein or polypeptide fragment or a semenogelin-specific antibody or active fragment, or a recombinant vector expressing the protein or antibody, is useful for inducing an immune response to a cancer in a mammal, where the cancer is not prostate cancer, particularly of epithelial origin such as lung cancer, papillary renal cell carcinoma, colon cancer, especially small-cell lung cancer (SCLC), or a melanoma. The present sequence represents the amino acid sequence of the thrombospondin-1 sequence containing synthetic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                 A new diagnosis for cancer other than prostate cancer in a mammal useful to detect cancer including lung cancer, particularly small cell lung cancer and melanoma comprises detecting semenogelin in a sample.
                                                    Human; thrombospondin-1; cytostatic; immunostimulant; cancer; epithelial cancer; lung cancer; papillary renal cell carcinoma; colon cancer; small-cell lung cancer; SCLC; melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 40; DB 6; Length 12; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a number of peptides which bind to alpha3beral integrins. They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid archritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides
                                                                                                                                                                                                                                                                                                                                                                                                        Alphalbetal integrin; angiogenesis; cell proliferation; cancer; diabetic retinopathy; restenosis; atherosclerosis; rheumatoid arthritis; macular degeneration; psoriasis; cell adhesion; cell motility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides that bind to or are recognized by alpha3-beta1 integrins, useful for inhibiting cell adhesion to extracellular matrix, cell motility and proliferation and for treating rheumatoid arthritis and
                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence is that of the N-terminal domain of human thrombospondin-1 (TSP) ADL70639. The invention relates to TSP fragments thrombospondin-1 (TSP) ADL70639. The invention relates to TSP fragment continued assays for cancer and for generation of antibodies and other binding agents. A method that distinguishes TSP fram a TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion involves: (1) using an epitope shared by TSP and the TSP fragment or portion of TSP plus TSP fragment or portion; (2) using an epitope present in TSP but not in the fragment or portion; (2) using an epitope present in TSP but not in the fragment or portion; (2) using an epitope present or protein of TSP plus TSP fragment or portion of TSP fragment or portion of SPP but amount of TSP fragment or portion. Suitable epitopes are provided ADL70602-ADL70639 betection or quantification of the TSP fragment or portion of SPP fragment or securities, renal allograft, asthma, diabetes mellitus, myocardial inferction, liver disease, splementowy, diabetes mellitus, myocardial inferction, liver disease, splementowy, diabetes mellitus, framal rallograft, varculities, juvenile rheumatory condition, recondition, are condition, are condition associated with intravascular coagulation, internal coagulation, an ordition and coagulation, and condition and coagulation, and condition and coagulation, and spontane reaction, and condition associated with a cryoglobuli, and a condition associated with a cryoglobuli, and a condition associated w biliary system, pancreas, head, neck, endocrine system, reproductive system male or female), genitourinary system, kidney, urinary tract, sensory system, nervous system, lymphoid organ, blood, a gland, mammary gland, prostate gland, endometrial tissue, mesodermal tissue, ectodermal tissue, endodermal tissue, a poorly-differentiated cancer, a well-differentiated cancer or a moderately differentiated cancer. New purified thrombospondin fragment extracted from a body fluid, useful for diagnosing cancer e.g. adenoma, adenocarcinoma, carcinoma, lymphoma or leukemia or as calibrators, indicators, immunogens and analytes. Disclosure; SEQ ID NO 40; 76pp; English. 20-AUG-2003; 2003WO-US026023. 23-AUG-2002; 2002US-0405494P. 21-APR-2003; 2003US-00419462.

```
The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single mucleocide polymorphism (SNP) in any one of the nucleocide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention further comprises; an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleocides is an SNP given in the specification or its complement and encoding any one of the amino the specification or its complement and encoding any one of the amino caid sequence given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification, an antibody that specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid molecule; a method of detecting an anetyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection method has cardiant activity.

                                                                                                                                                                                                                                                                                 The invention relates to a novel method for identifying an individual who cast an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an ancleic acids where the presence of the SNP is correlated with an activate risk for myocardial infarction in the individual. The invention turther comprises: an isolated nucleic acid molecule comprising at least a contiguous nucleotides where one of the nucleotides is an SNP given in the specification, an isolated polypeptide comprising an amino acid sequence given in the specification, an isolated polypeptide comprising an amino acid sequence given in the specification; an antibody comprising an amino acid sequence given in the specification; an inthe specification and which is between about 16 and 1000 nucleotides in the specification and which is between about 16 and 1000 nucleotides in comprising the polymucleotide, and an SNP in a nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and an enthod for identifying an agent useful in treating or preventing myocardial infarction. The novel detection may be used in gene therapy. The method is useful in identifying an individual who has an increased or
                                                                                ö
                                                                                                                                                                                                                                                                                 Human myocardial infarction-associated gene derived protein, SEQ ID 1020.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                            Myocardial infarction; detection; single nucleotide polymorphism; SNP; cardiant; gene therapy; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of garanlocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen PS3, and vascative intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various discorders including cardiovascular diseases such as arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor 1C; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; nontiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality; vascular disorder; asbestosis.
decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarctionassociated gene containing one or more SPP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Angiotensin converting enzyme (ACEV) splice variant protein #16.

"Cloning, characterization and expression of thrombospondin-1 in
"Cloning, characterization and expression of thrombospondin-1 in
"Cloning, characterization and expression of thrombospondin-1 in
"Submitted (May-1993) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Adhesive glycoprotein that mediates cell-to-cell and
cell-to-matrix interactions. Can bind to fibrinogen, fibronectin,
laminin, type V collagen and integrins alpha-V/beta-1, alpha-
V/beta-3 and alpha-IIb/beta-3 (By similarity).

-!- SUBUNIT: Homotrimer; disulfide-linked.

-!- SIMILARITY: Contains 3 EGF-like domains.

-!- SIMILARITY: Contains 1 TSP C-terminal (TSPN) domain.

-!- SIMILARITY: Contains 3 TSP type-1 domains.

-!- SIMILARITY: Contains 7 TSP type-1 domains.

-!- SIMILARITY: Contains 7 TSP type-3 domains.

-!- SIMILARITY: Contains 1 VWFC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

Sequence 482, Application US/09949002

Patent No. 690016

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH INFLAMMATORY AUTOIMMUNE DISEASE, METHODS OF DETECTION

TITLE OF INVENTION: AND USES THERROF

FILE REFERENCE: CLO00790

CURRENT FILING DATE: 2000-01-28

PRIOR PILIAG DATE: 2000-01-28

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 10823

SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Sequence 5916, Application US/09621976

Patent No. 6639063

GENERAL INFORMATION:

APPLICANT: Johnas Milne Edwards, J.B.

APPLICANT: Johnas Milne Edwards, J.B.

APPLICANT: Johnas Milne Edwards, J.Y.

TITLE OF INVENTION: ESTS and Encoded Human Proteins.

FILE REFERENCE: GENERE 1054PR2.

CURRENT APPLICATION UNMBER: US/09/621,976

CURRENT PILICATION NUMBER: US/09/621,976

CURRENT PILICATION NUMBER: US/09/621,976

SOFTWARE: Patent.pm

SEQ ID NO 5916

Sequence 16180, Application US/09248796A

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.132

CURRENT APPLICATION NUMBER: US 60/09/248, 796A

CURRENT FILING DATE: 1999-02-13

PRIOR APPLICATION NUMBER: US 60/096, 409

PRIOR APPLICATION NUMBER: US 60/096, 409

NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 16180
APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH INFLAMMATORY AUTOIMMUNE DISEASE, METHODS OF DETECTION

GENERAL INFORMATION:

APPLICANT: GARY BRETON

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL1

TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

FILE REFERENCE: 2709.1002-001

CURRENT APPLICATION NUMBER: US/09/543,681A

CURRENT FILING DATE: 1999-04-05

PRIOR FILING DATE: 1999-04-09

PRIOR FILING DATE: 1999-04-09

SEQ ID NOS: 8344

SEQ ID NO 6072
                                                                                                                                                                                                                                                                                                                                                                    ö

Publication No. US20060110390A1

GENERAL INFORMATION:

APPLICANT: LEINWAND, LESLIE

APPLICANT: SUCHAROV, CARRIN

TITLE OF INVENTION: INHIBITION OF KU AS A TREATMENT FOR CARDIOVASCULAR

TITLE OF INVENTION: DISEASES

FILE REFERENCE: MYOG:58US

CURRENT APPLICATION NUMBER: US/11/203,828

PRIOR APPLICATION NUMBER: 60/604,435

PRIOR APPLICATION NUMBER: 60/604,435

NUMBER OF SEQ ID NOS: 7

SOFTWARE: Patentin Ver. 2.1

Krutzsch HC; Roberts DD,

WPI; 2001-182656/18.

New peptides that bind to or are recognized by alpha3-betal integrins, useful for inhibiting cell adhesion to extracellular matrix, cell motility and proliferation and for treating rheumatoid arthritis and cancer.

Claim 4; Page 34; 84pp; English.

The present invention provides a number of peptides which bind to alpha3betal integrins. They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatolid arthritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of peptides which bind to alpha3betal integrins. They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid arthritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides

They are useful in the modulation of cell adhesion and motility, and in the treatment of cancer, diabetic retinopathy, rheumatoid arthritis, macular degeneration, atherosclerosis, psoriasis and restenosis. The present sequence is an example of one of the peptides
Alpha3beta1 integrin; angiogenesis; cell proliferation; cancer; diabetic retinopathy; restenosis; atherosclerosis; rheumatoid arthritis; macular degeneration; psoriasis; cell adhesion; cell motility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides that bind to or are recognized by alpha3-beta1 integrins, useful for inhibiting cell adhesion to extracellular matrix, cell motility and proliferation and for treating rheumatoid arthritis and

The invention relates to diagnosing cancer other than prostate cancer in a male mammal, comprising assaying a test sample for increased level of semenogelin, or cancer in a female by assaying for the presence of semenogelin. Administering a semenogelin protein or polypeptide fragment or a semenogelin specific antibody or active fragment, or a recombinant vector expressing the protein or antibody, is useful for inducing an immune response to a cancer in a mammal, where the cancer is not prostate cancer and semenogelin is a marker. The invention is used to diagnose cancer, particularly of epithelial origin such as lung cancer, papillary renal cell carcinoma, colon cancer, especially small-cell lung cancer (SCLC), or a melanoma. The present sequence represents the amino acid sequence of the thrombospondin-1 sequence containing synthetic peptide which binds to alpha-3-beta-1 integrin A new diagnosis for cancer other than prostate cancer in a mammal useful to detect cancer including lung cancer, particularly small cell lung cancer and melanoma comprises detecting semenogelin in a sample. The present sequence is that of the N-terminal domain of human thromosopondin-1 (TSP) ADL/7639. The invention relates to TSP fragments (G-linical sasays for 20-35 Mam Mol. Wt.) found in plasma, and their use in (BO-100, 40-55 or 20-35 Mam Mol. Wt.) found in plasma, and their use in clinical sasays for cancer and for generation of antibodies and other principal department of portion involves (I) using an epitope shared by TSP and the TSP fragment or portion as a target for a binding molecule, e.g. an antibody, to obtain a quantitation of TSP plus of in the fragment or portion to obtain a quantitation of the amount of TSP fragment or portion of obtain a quantitation of the amount of TSP fragment or portion of the TSP fragment or the TSP fragment o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human myocardial infarction-associated gene derived protein, SEQ ID 1022.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tissue, endodermal tissue, a teratoma, a poorly-differentiated cancer, a well-differentiated cancer or a moderately differentiated cancer.

04-MAR-2004

Human myocardial infarction-associated gene derived protein, SEQ ID 1020.

```
The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's caltered risk for myocardial infarction in the individual one of altered risk for myocardial infarction in the individual. The invention further comprises an isolated nucleic acid molecule comprising at least sontiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino acid sequences given in the specification; an isolated polypeptide comprising an amino acid sequence given in the specification, an antibody that specification and main and specification; an isolated polypeptide comprising an supplication and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and a method is useful in identifying an individual who has an increased or comprising the method is useful in identifying an individual who has an increased or commonstation for reventing myocardial infarction may be used in gene therapy. The method is useful in identifying an individual who has an increased or commonstation for reventing myocardial infarction may be used in gene therapy. The method is useful in identifying an individual who has an increased or commonstation for revenenting myocardial infarction may be used in gene therapy. The method is useful in identifying myocardial infarction may be used in gene therapy. The method is useful in revenenting myocardial infarction may be used in gene therapy. The method is useful in identifying myocardial infarction method is proparating and myocardial infarction method is used in gene in the inventor myocardial infarction method is used in gene in the inventor myocardial infarction 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              associated gene containing one or more SNP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 10; SEQ ID NO 1022; 145pp; English.

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nuclectide polymorphism (SNP) in any one of the nucleic acids, where the presence of the SNP is correlated with an or altered risk for myocardial infarction in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The individual curther comprises: an isolated nucleic acid molecule comprising at least a contiguous nucleotides where one of the nucleotides is an SNP given in the specification or its complement and encoding any one of the amino the specification and in the specification; an intibody that specificatly binds to the polypeptide or its antigen-binding that specification and which is between about 16 and 1000 nucleotides in length; a kit for detecting an SNP in a nucleic acid molecule; a method of detecting an SNP in a nucleic acid molecule; a method of detecting a variant polypeptide; and method for identifying an agent useful in treating or preventing an composition for treating or preventing myocardial infarction. The novel detection method has an increased or decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This sequence represents the protein of a human myocardial infarction. This sequence was not shown in the specification for the invention. Note: This sequence was not shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelat-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary atterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as abestosis and vascular pathologies involving an endothelial abnormality such as deep vein thrombosis

include: cytostatic; prolliferative, vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antidiabetic; antiasthmatic; antirheumatic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; coortropic; vasotropic; antiporiatic and antianglogenic. The coortropic; antiporiatic and antianglogenic. The polynucleotides and polypeptides can be used for preventing, treating or coortropic; polynucleotides, polypeptides can be used for preventing, treating or corpustion may be used to treat immune disorders by activating the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune clicancers, allergic reactions, graft versus host disease and organic rejection, modulate haemostatic or thrombolytic activity, modulate confirmation, cancers, cardiovascular disorders, nucleotides, antibodies, bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities
                                                                                                                                                                         Human; cancer associated gene; cancer antigen; detection; cancer; diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antiarchritic; antidativitic; antidativitic; antidativitic; antidativitic; antidativitic; antidativitic; antidation; antidation; antiphyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antiangiogenic; gene therapy; inflammation; immune disorder; haematopoietic cell disorder; autoimmune disorder; allergic reaction; graft versus host disease; organ rejection; haemostatic; thrombolytic; cardiovascular disorder; infection; neurological disease; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 56; DB 3; Length 466;

```
The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy,
                                                                                                                                                                                               Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor IC; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complex nephritis; deep vein thrombosis; vascular disorder; asbestosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders such as immune complex nephritis, multiple sclerosis,
                                                                                                                                                               Angiotensin converting enzyme (ACEV) splice variant protein #15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 56; DB 4; Length 546;

The present invention relates to a novel recombinant adenovirus vector mediated anti-neoplastic composition is prepared through cloning the cDNA sequence from the human peripheral blood cell by specific primer and reverse transcription-polymerase chain reaction (RT-PCR) method for coding TSF polypeptide, construction in human embryonic kidney cell 293 by AdBasy system, and packaging and expressing the recombinant adenovirus vector of TSF. It can suppress the growth and transfer of cancer. The present sequence represents the TSF polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              granulocyte colony strumlating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor 1C; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; myocardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality;

(ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1c, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated mucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, cancer, sarcoidosis, nonarcoidocic pulmonary granulomatous diseases such as such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidocic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TSP-1; TSP-2; COMP; cartilage oligomeric matrix protein; thrombospondin; angiogenesis; tumour; treatment; cancer; arthritis; psoriasis; diabetic retinopathy; corneal graft rejection; glaucoma.
                                                                                                                                                                                                                                                                                                                                                                                      Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence represents an angiotensin converting enzyme splice variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 56; DB 4; Length 731;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      THERESEA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor 1C; vasoactive intestinal polypeptide receptor 2; arteriosclerosis; cancer; mycorardial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; multiple sclerosis; immune complex nephritis; deep vein thrombosis;
                                                                                                                                                                                                                                                                                                                                                                                        Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nonarcoidotic pulmonary granulomatous disease; endothelial abnormality;

                                                                                                                                                                                                                                                                                                                                                                                                                                      Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Domain
  New nucleic acids are described which encode a protein comprising the second and third type 1 repeats of human TSP (thrombospondin)-1, but not the TYE (transforming growth factor)-beta acityvation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage oligomeric matrix protein) assembly sequence (COMP/TSP-1) was produced by PCR (polymerase chain reaction). Expression of COMP/TSP-1 caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful of or treating angiogenesis related diseases such as cancer (by reducing the rate of growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glaucoma. They may also be used for treating human immunodeficiency virus (HIV) infection. Anti-cancing human immunodeficiency virus (HIV) infection. Anti-cancing human immunodeficiancy be not require the therapeutic agent to enter tumour cells or cross the blood-brain barrier, controls tumour growth independently of growth of tumour cell heterogeneity, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Thrombospondin-1; TSP-1; cytostatic; angiogenesis; vasotropic; vulnerary; necvascularisation; cell proliferation inhibitor; cancer; solid tumour; haemangioma; acoustic neuromas; neurofibroma; trachoma; acoustic neuromas; retroma; trachoma; retropachic granulomas; rheumatoid arthritis; ocular angiogenic disease; retinopathy; psoriasis; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rebebosis; angiofibroma; Osler-Webber syndrome; myocardial angiogenesis; haemophiliac joints; plaque neovascularisation; telangiectasia; wound granulation; apoptosis.
